- **Pre-operative Planning:** The handbook aids in comprehensive pre-operative assessment, helping anaesthesiologists identify potential risks and tailor anaesthetic strategies accordingly. This includes careful evaluation of cardiac function, pulmonary status, and co-morbidities.
- **Intra-operative Management:** During cardiac procedures, the handbook assists in making informed decisions regarding fluid management, haemodynamic support, and the use of various anaesthetic agents. The clear guidelines on

intraoperative monitoring are particularly helpful.

- **Post-operative Care:** The handbook provides guidance on post-operative pain management, weaning from mechanical ventilation, and managing potential complications. This ensures a smooth transition from the operating room to the recovery phase.

Case Study and Practical Application

Consider a patient scheduled for coronary artery bypass grafting (CABG). Using the Oxford handbook, the anaesthesiologist can systematically assess the patient's cardiac risk profile, plan for appropriate haemodynamic monitoring (including invasive techniques), select suitable anaesthetic agents, and anticipate potential intra-operative complications such as hypotension or arrhythmias. The handbook's algorithms and decision trees will guide the management of these complications. Post-operatively, the

handbook facilitates optimized pain management and close monitoring for complications such as atrial fibrillation.
