Philips Avent Manual Breast Pump: Assembly and Usage

Before your first use, carefully read the included instruction manual provided with your specific

Philips Avent manual breast pump model. While the general principles are similar across models, minor variations might exist. The typical assembly process generally involves:

- **Connecting the parts:** Attach the breast shield (funnel) to the bottle or collection container. Ensure a secure fit. Some models might have a membrane or valve system which needs to be positioned correctly, referring to the manual for guidance is essential.
- **Preparing the breast:** Gently massage your breast to stimulate milk flow before starting to pump. Warm compresses can further enhance milk let-down.
- **Positioning the breast shield:** Ensure the nipple is centered within the breast shield, to maximize comfort and milk extraction efficiency. The shield shouldn't pinch or cause discomfort.
- **Pumping Technique:** The pumping action generally involves a gentle, rhythmic compression and release of the handle. Don't rush the process. A slow, steady pace is usually more effective. Experiment with different speeds and pressure to find what works best for you. Rest when needed to prevent fatigue. This is particularly important with your **Philips Avent Manual Breast Pump** as understanding the rhythm is key to comfortable and efficient pumping.
- **Milk Collection:** Once you have finished pumping, carefully detach the parts to avoid

spills. Pour the collected breast milk into a sterile container for storage.

Troubleshooting Common Issues:

- **Low Milk Output:** This could be due to incorrect positioning of the breast shield, insufficient stimulation, or stress. Try repositioning the breast shield, massaging your breasts beforehand, and trying relaxation techniques. Remember, sometimes milk supply can vary.
- **Pain or Discomfort:** If you experience pain during pumping, immediately stop. Check the breast shield placement, reduce suction strength, or try a different pumping position. Pain is never normal and should be addressed.
- **Leakage:** Ensure all parts are correctly assembled and sealed. If you still have leakage, check for any cracks or damage to the components.
